

EMA domain means by participant

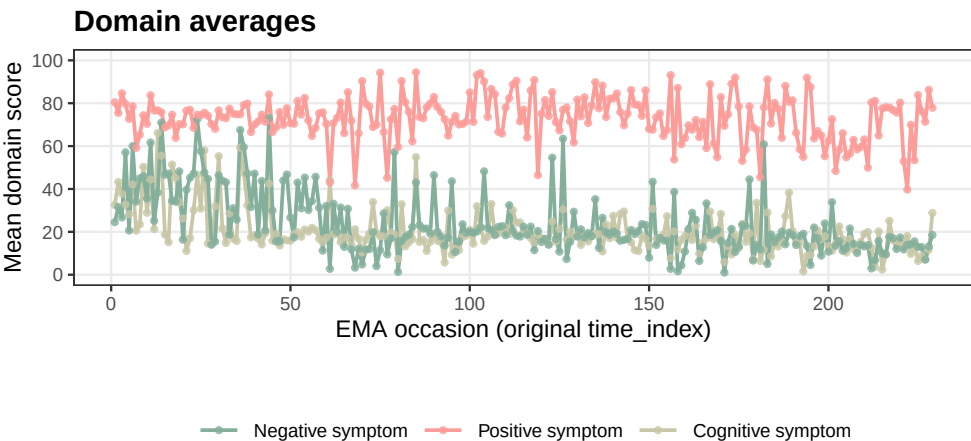

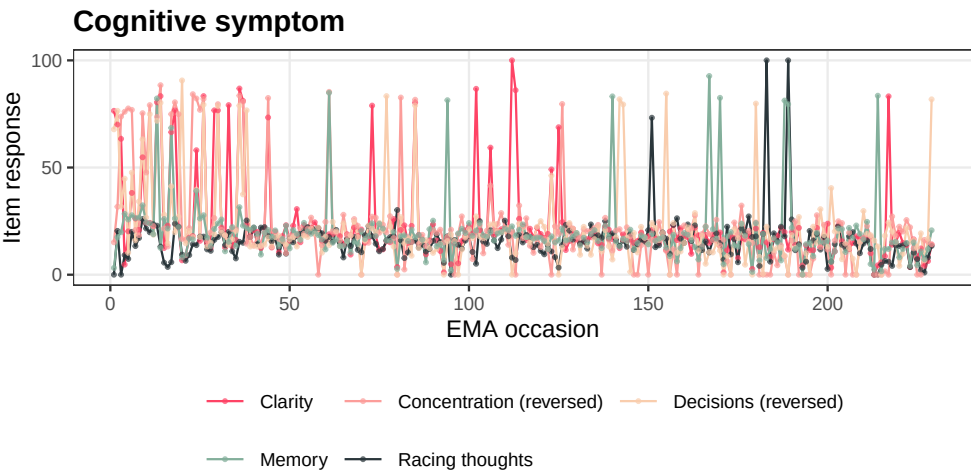

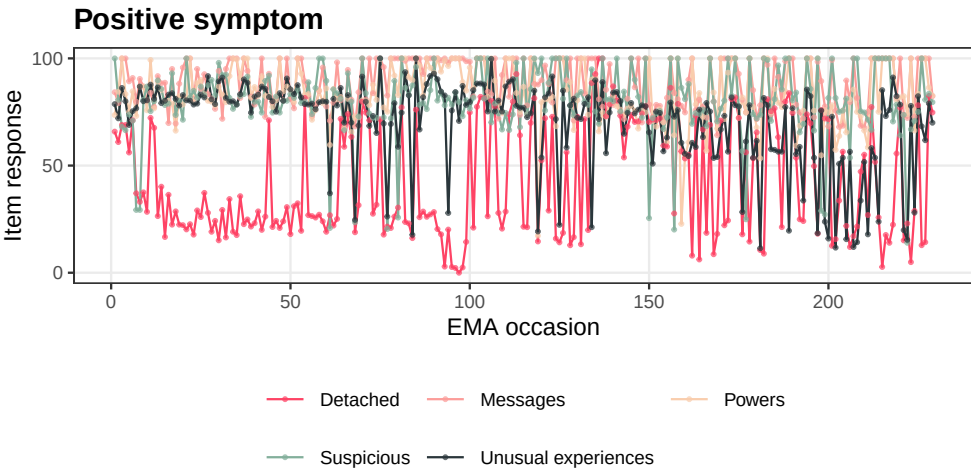

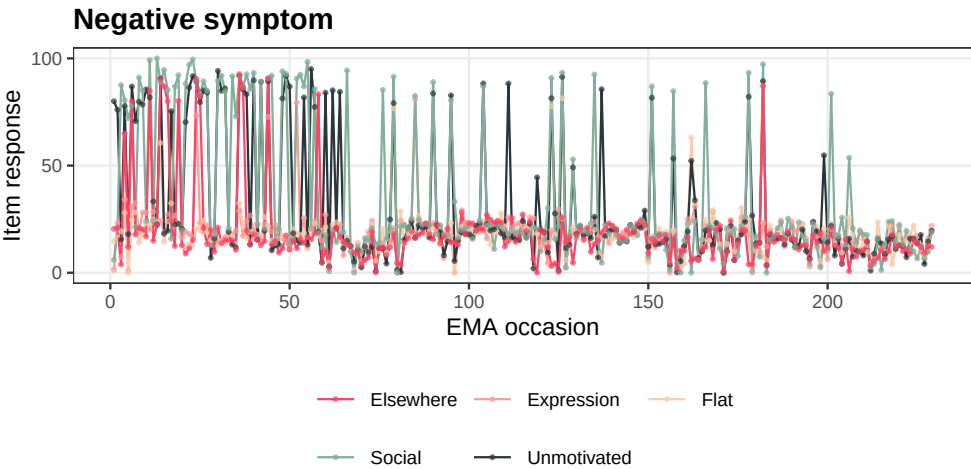

All included participants

This report includes **82 participants** retained in `esm_cleaned.csv`. Each participant has one page with four panels: item responses for each of the three symptom domains, and all three domain averages together.

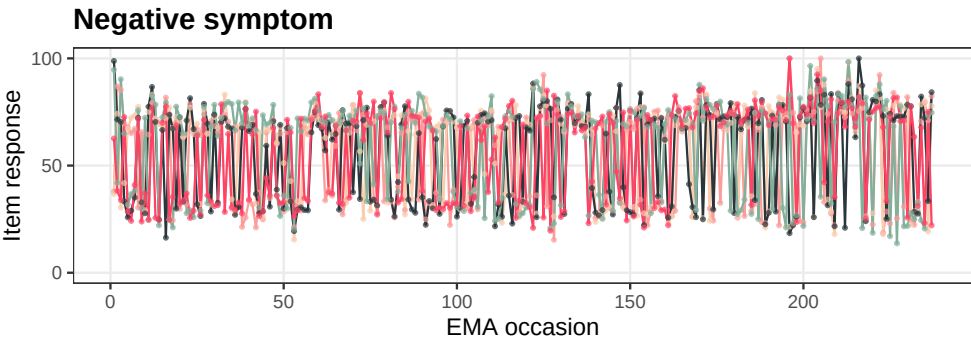

Domain scores are the mean of available items at each EMA occasion. Higher scores indicate greater symptom endorsement. Concentration and decision-making items were already reverse-coded during cleaning; no additional reversal is applied.

The horizontal axis retains the original EMA occasion index. Missing responses and skipped occasion numbers break lines. All panels use the same 0-100 scale. Scores are not smoothed. The item panels allow inspection of whether items change together; the average panel summarizes the overall domain trajectories.
